*Computer Networking: A  
Top-Down Approach*

8<sup>th</sup> edition

Jim Kurose, Keith Ross  
Pearson, 2020

# Chapter 3: roadmap

- Transport-layer services
- Multiplexing and demultiplexing
- Connectionless transport: UDP
- Principles of reliable data transfer
- **Connection-oriented transport: TCP**
  - segment structure
  - reliable data transfer
  - flow control
  - connection management
- Principles of congestion control
- TCP congestion control

# TCP flow control

Q: What happens if network layer delivers data faster than application layer removes data from socket buffers?

# TCP flow control

Q: What happens if network layer delivers data faster than application layer removes data from socket buffers?

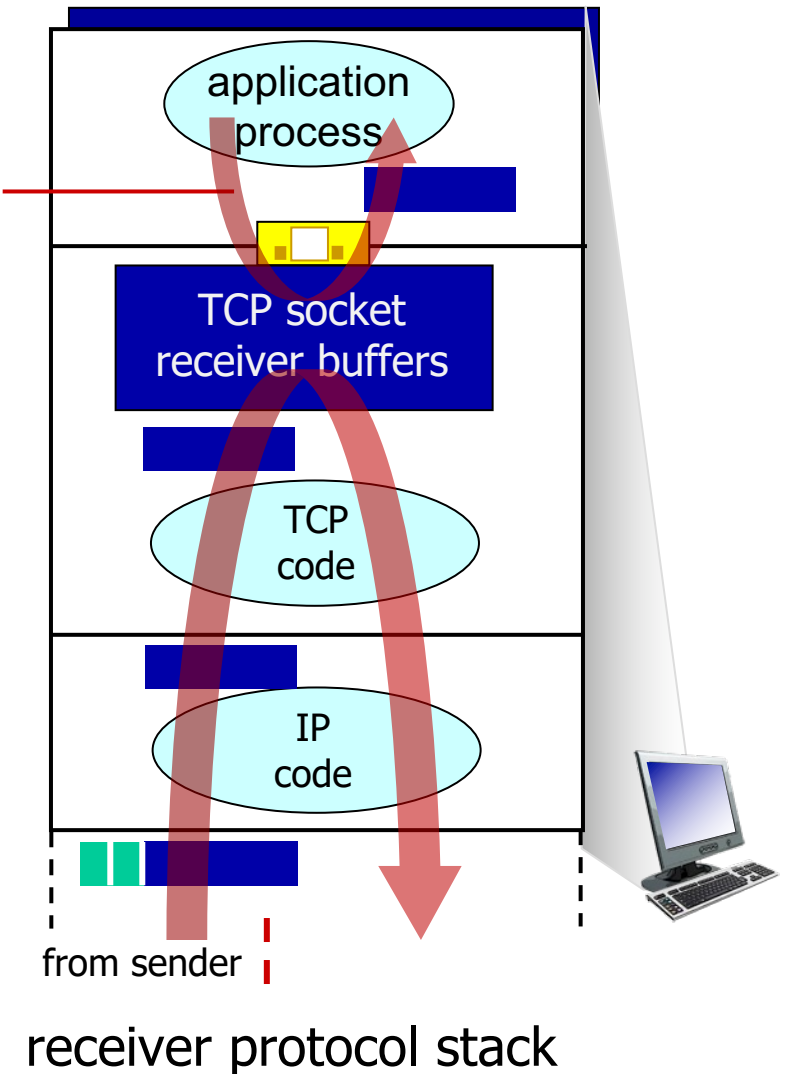

# TCP flow control

Q: What happens if network layer delivers data faster than application layer removes data from socket buffers?

flow control: # bytes  
receiver willing to accept

Application removing  
data from TCP socket  
buffers

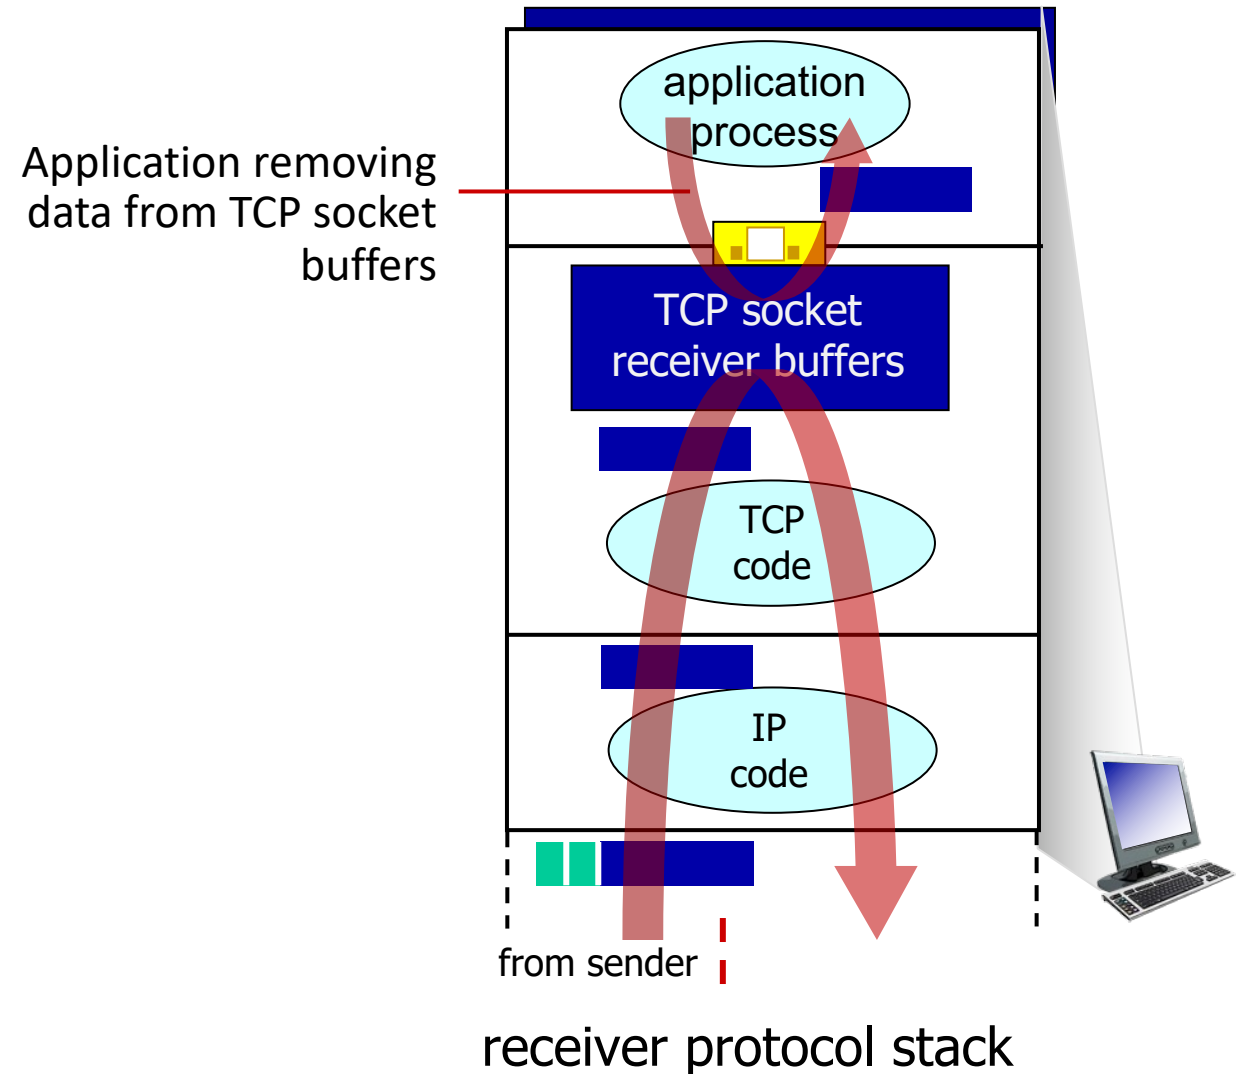

# TCP flow control

Q: What happens if network layer delivers data faster than application layer removes data from socket buffers?

## —flow control—

receiver controls sender, so sender won't overflow receiver's buffer by transmitting too much, too fast

# TCP flow control

- TCP receiver “advertises” free buffer space in **rwnd** field in TCP header
  - **RcvBuffer** size set via socket options (typical default is 4096 bytes)
  - many operating systems auto-adjust **RcvBuffer**
- sender limits amount of unACKed (“in-flight”) data to received **rwnd**
- guarantees receive buffer will not overflow

# TCP flow control

- TCP receiver “advertises” free buffer space in **rwnd** field in TCP header
  - **RcvBuffer** size set via socket options (typical default is 4096 bytes)
  - many operating systems auto-adjust **RcvBuffer**
- sender limits amount of unACKed (“in-flight”) data to received **rwnd**
- guarantees receive buffer will not overflow

flow control: # bytes receiver willing to accept

TCP segment format

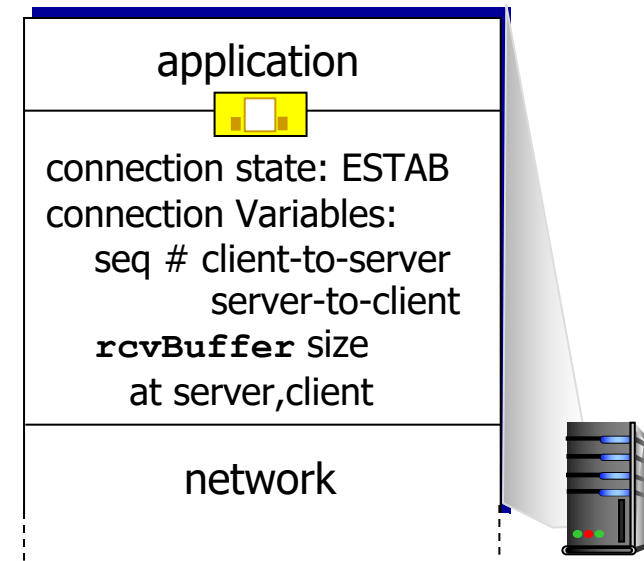

# TCP connection management

before exchanging data, sender/receiver “handshake”:

- agree to establish connection (each knowing the other willing to establish connection)
- agree on connection parameters (e.g., starting seq #s)

```
Socket clientSocket =  
    newSocket("hostname", "port number");
```

```
Socket connectionSocket =  
    welcomeSocket.accept();
```

# Agreeing to establish a connection

2-way handshake:

Q: will 2-way handshake always work in network?

- variable delays
- retransmitted messages (e.g. req\_conn(x)) due to message loss
- message reordering
- can't "see" other side

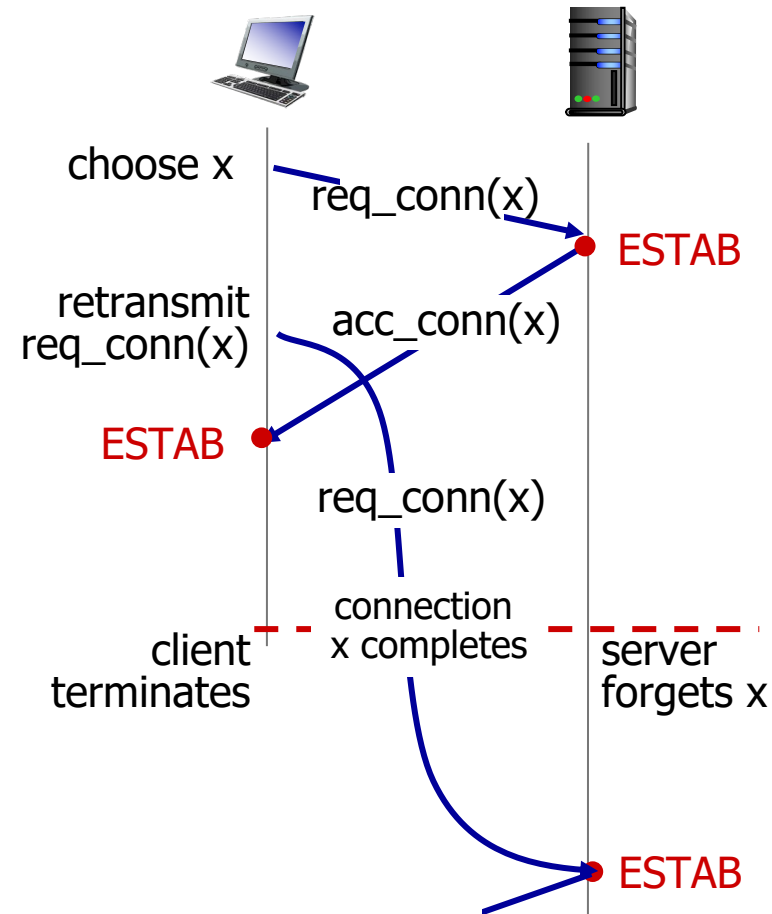

# 2-way handshake scenarios

No problem!

# 2-way handshake scenarios

 Problem: half open connection! (no client)

# 2-way handshake scenarios

 Problem: dup data accepted!

# TCP 3-way handshake

## Client state

```
clientSocket = socket(AF_INET, SOCK_STREAM)
```

LISTEN

```
clientSocket.connect((serverName, serverPort))
```

SYNSENT

ESTAB

choose init seq num, x  
send TCP SYN msg

SYNbit=1, Seq=x

SYNbit=1, Seq=y  
ACKbit=1; ACKnum=x+1

received SYNACK(x)  
indicates server is live;  
send ACK for SYNACK;  
this segment may contain  
client-to-server data

ACKbit=1, ACKnum=y+1

received ACK(y)  
indicates client is live

## Server state

```
serverSocket = socket(AF_INET, SOCK_STREAM)  
serverSocket.bind(('', serverPort))  
serverSocket.listen(1)  
connectionSocket, addr = serverSocket.accept()
```

LISTEN

SYN RCVD

ESTAB

choose init seq num, y  
send TCP SYNACK  
msg, acking SYN

# A human 3-way handshake protocol

# Closing a TCP connection

- client, server each close their side of connection
  - send TCP segment with FIN bit = 1
- respond to received FIN with ACK
  - on receiving FIN, ACK can be combined with own FIN
- simultaneous FIN exchanges can be handled

# Chapter 3: roadmap

- Transport-layer services
- Multiplexing and demultiplexing
- Connectionless transport: UDP
- Principles of reliable data transfer
- Connection-oriented transport: TCP
- **Principles of congestion control**
- TCP congestion control
- Evolution of transport-layer functionality

# Principles of congestion control

## Congestion:

- informally: “too many sources sending too much data too fast for *network* to handle”
- manifestations:
  - long delays (queueing in router buffers)
  - packet loss (buffer overflow at routers)
- different from flow control!
- a top-10 problem!

**congestion control:**

too many senders,  
sending too fast

**flow control:** one sender  
too fast for one receiver

# Causes/costs of congestion: scenario 1

Simplest scenario:

- one router, infinite buffers
- input, output link capacity:  $R$
- two flows
- no retransmissions needed

**Q:** What happens as arrival rate  $\lambda_{in}$  approaches  $R/2$ ?

maximum per-connection throughput:  $R/2$

large delays as arrival rate  $\lambda_{in} \rightarrow R/2$

# Causes/costs of congestion: scenario 2

- one router, *finite* buffers
- sender retransmits lost, timed-out packet
  - application-layer input = application-layer output:  $\lambda_{in} = \lambda_{out}$
  - transport-layer input includes *retransmissions* :  $\lambda'_{in} \geq \lambda_{in}$

# Causes/costs of congestion: scenario 2

Idealization: perfect knowledge

- sender sends only when router buffers available

# Causes/costs of congestion: scenario 2

Idealization: *some* perfect knowledge

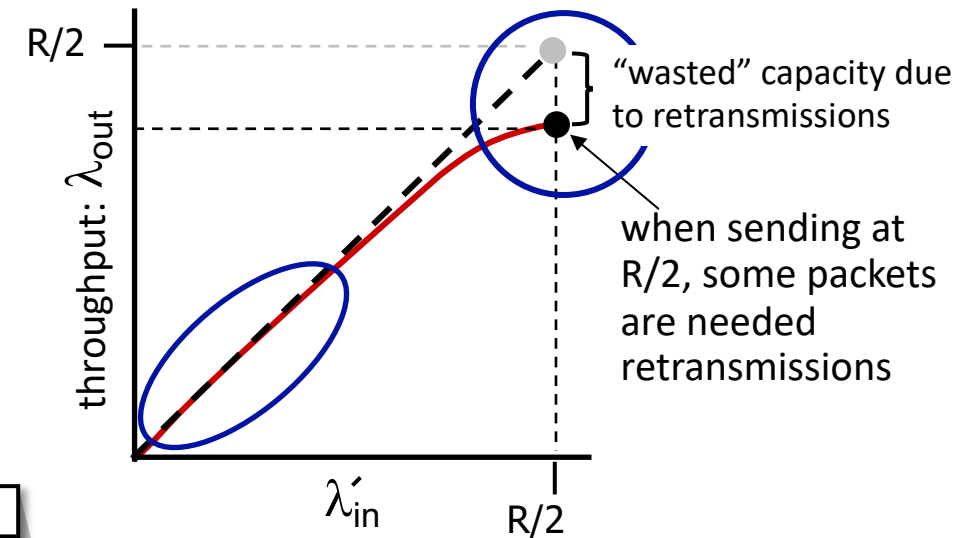

- packets can be lost (dropped at router) due to full buffers
- sender knows when packet has been dropped: only resends if packet *known* to be lost

# Causes/costs of congestion: scenario 2

## Idealization: *some* perfect knowledge

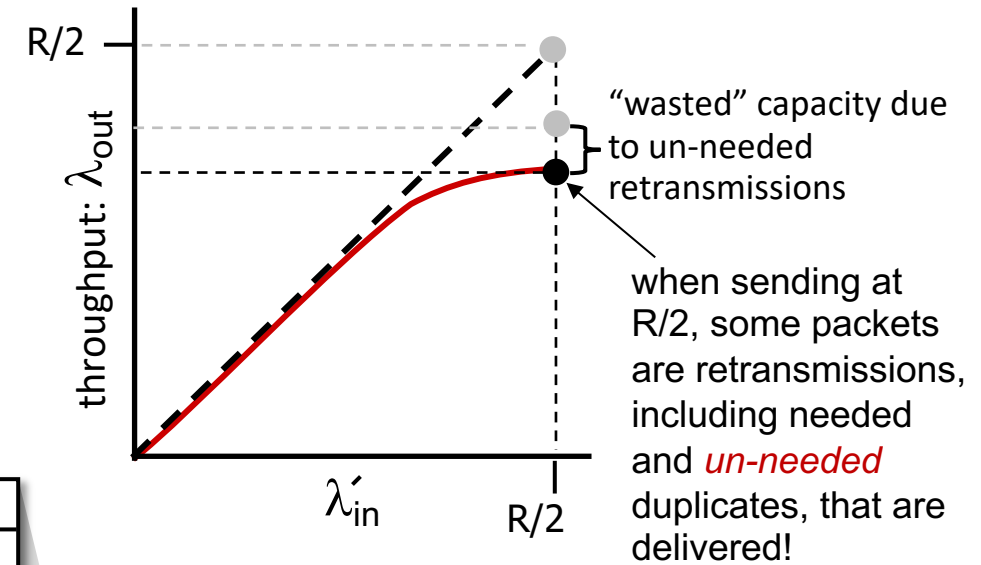

- packets can be lost (dropped at router) due to full buffers
- sender knows when packet has been dropped: only resends if packet *known* to be lost

# Causes/costs of congestion: scenario 2

## Realistic scenario: *un-needed duplicates*

- packets can be lost, dropped at router due to full buffers – requiring retransmissions
- but sender times can time out prematurely, sending *two* copies, *both* of which are delivered

# Causes/costs of congestion: scenario 2

## Realistic scenario: *un-needed duplicates*

- packets can be lost, dropped at router due to full buffers – requiring retransmissions
- but sender times can time out prematurely, sending *two* copies, *both* of which are delivered

## "costs" of congestion:

- more work (retransmission) for given receiver throughput
- unneeded retransmissions: link carries multiple copies of a packet
  - decreasing maximum achievable throughput

# Causes/costs of congestion: scenario 3

- *four* senders
- *multi-hop* paths
- timeout/retransmit

Q: what happens as  $\lambda_{in}$  and  $\lambda'_{in}$  increase ?

A: as red  $\lambda'_{in}$  increases, all arriving blue pkts at upper queue are dropped, blue throughput  $\rightarrow 0$

# Causes/costs of congestion: scenario 3

another “cost” of congestion:

- when packet dropped, any upstream transmission capacity and buffering used for that packet was wasted!

# Causes/costs of congestion: insights

- throughput can never exceed capacity
- delay increases as capacity approached
- loss/retransmission decreases effective throughput
- un-needed duplicates further decreases effective throughput
- upstream transmission capacity / buffering wasted for packets lost downstream

# Approaches towards congestion control

## End-end congestion control:

- no explicit feedback from network
- congestion *inferred* from observed loss, delay
- approach taken by TCP

# Approaches towards congestion control

## Network-assisted congestion control:

- routers provide *direct* feedback to sending/receiving hosts with flows passing through congested router
- may indicate congestion level or explicitly set sending rate
- TCP ECN, ATM, DECbit protocols
